

Pattern to identify header

Copyright © 2017 Chandra Lingam

Write a pattern to identify sensor data header.

It should look for a four-digit year, two-digit month and two-digit day at the beginning of a line.

Matching values should be captured using their respective named groups: **year, month and day**

For example, with this data:

```
2016052006890290701029NNNN030NNNNNNN
```

```
20160521070602906970290717NNNNNNNNNN
```

```
201605220694029069603107060350703034
```

First match should be: **20160520** and named groups should contain

year: 2016

month: 05

day: 20

Second match should be **20160521**

and so forth
