

Pattern for Matching Cell

Copyright © 2017 Chandra Lingam

A Cell in a html is identified using "td" or "th" element. `<td>....cell content...</td>` `<th>....cell content...</th>`

Cell can also be empty. `<td/>` `<th />`

Cell can also contain additional attributes. `<th align=right>....cell content...</th>` `<td align=right>....cell content...</td>`

Write a pattern that can match empty cell or cell content. If cell content is available, it should be captured in a named group "col"

For example, when given a text:

```
<th align="left">Cholesterol (mg/dL)</th><td>135</td>
```

First match should be: `<th align="left">Cholesterol (mg/dL)</th>` with named group

col:Cholesterol (mg/dL)

Second match should be: `<td>135</td>` with named group

col:135
