Pattern to Capture Metrics Table

Write a pattern to capture **Dirs, Files** and **Bytes** metrics values from the below table.

It should capture Total, Copied, Skipped, Mismatch, Failed and Extras columns for each of the rows

An example is given here

```
   -------------------------------------------------------------------------

              Total     Copied   Skipped  Mismatch     FAILED     Extras

      Dirs :        7        6        1         0          0          0

     Files :       29       29        0         0          0          0

     Bytes :   133567   133567        0         0          0          0

     Times :   0:00:00  0:00:00                        0:00:00    0:00:00

     Speed :            8904466 Bytes/sec.

     Speed :            509.517 MegaBytes/min.

     Ended : Sunday, May 1, 2016 1:59:16 PM
```

With the above text,

First match should match "Dirs" row and capture the values in following named groups:

type *Dirs*

total *7*

copied 6

skipped 1

mismatch 0

failed 0

extras 0

Subsequent matches should match the rows for **Files** and **Bytes**
